A new fold in the scorpion toxin family, associated with an activity
on a ryanodine-sensitive calcium channel.";

Proteins 40:436-442(2000)

-I- FUNCTION: Pocently and reversibly modifies channel gating behavior
of the type I ryanodine receptor (RYR1) by inducing prominent
subconductance behavior. Binds a different site as ryanodine.
                                                                                                                                                                                                                                         SEQUENCE, SYNTHESIS, AND MASS SPECTROMETRY.

"Mouse D113: a novel divergent Delta gene which may complement the function of other Delta homologues during early pattern formation in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DISEASE: A truncating mutation in D113 is the cause of the pudgy (pu) phenotype. Pudgy mice exhibit patterning defects at the earliest stages of somitogenesis. Adult pudgy mice present severe vertebral and rib deformities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  paraxial mesoderm.
SUBUNIT: Can bind and activate Notch-1 or another Notch receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isold=088516-2; Sequence=VSP 001376; TISSUE SPECIFICITY: Predominantly expressed in the neuroectoderm
                                                                                                                                                                                        Mus musculus (Mouse).

-!- FUNCTION: Omega-conotoxins act at presynaptic membranes, they bind and block voltage-sensitive calcium channels (VSCC). This toxin blocks N-type calcium channels.
-!- SUBCELLULAR LOCATION: Secreted.
-!- FUNCTION: SPECIFICITY: Expressed by the venom duct.
-!- PHARMACEUTICAL: Is under clinical trial by Neurex. It blocks acute pain in patients who no longer obtain relief from opiate drugs. It is 100 to 1000 times more potent than morphine. By blocking calcium channels it disable nerves that transmit pain signals.
-!- SIMILARITY: Belongs to the conotoxin O-superfamily. Omega-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Atkinson R.A., Kieffer B., Dejaegere A., Sirockin F., Lefevre J.-F., "Structural and dynamic characterization of omega-conotoxin MVIIA: the binding loop exhibits slow conformational exchange."; Biochemistry 39:3908-3919(2000).

J. Biol. Chem. 275:35335-35344(2000).
-!- FUNCTION: Omega-conotoxins act at presynaptic membranes, they bin and block voltage-sensitive calcium channels (VSCC) (By similarity). This toxin blocks N-type calcium channels.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Expressed by the venom duct.
-!- SIMILARITY: Belongs to the conotoxin O-superfamily. Omega-type
                                                                                                                                                                                                       Gaps

C-I- FUNCTION: Protamines substitute for histones in the chromatin of
Sperm during the haploid phase of spermatogenesis. They compact
Sperm DNA into a highly condensed, stable and inactive complex.
This protamine condenses spermiogenic chromatin in a pattern which
Comprises fibres with a progressively larger diameter and lamellae
C-I- Subgunit: Cross-linked by interchain disulfide bonds around the
DNA-helix (By similarity).
C-I- SUBGLELIOLAR LOCATION: Nuclear.
-I- TIGGELELIOLAR LOCATION: Nuclear.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The C. elegans sequencing consortium, "Genome sequence of the nematode C. elegans: a platform for investigating biology.", Science 282:2012-2018 (1998).
-!- FUNCTION: Orphan nuclear receptor. Seems to be required during development. Disruption of nhr-25 function leads to embryonic arrest due to failure of the epidermally mediated process of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ISOId=019345-2; Sequence=VSP 003723;
-!- TISSUB SPECIFICITY: Expressed in the epidermis, the developing somatic gonad, and a subset of other epithelial cells.
-!- SIMILARITY: Belongs to the nuclear hormone receptor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1;

                                                                                                                                                                                                                                                                                                                                                                                             containing ryanddine receptor, type 3.";
Biophys. J. 82:1319-1328(2002).
-!-FUNCTION: Strong agonist of ryanddine receptors (calcium release channels). Induces voltage- and concentration-dependent subconductance states in both skeletal (RYR1 and RYR3) and cardiac (RYR2) ryanodine receptors by binding to a single, cytosolically accessible site different from the ryanodine binding site.
-:-SUBCELLULAR LOCATION: Secreted.
-:-SUBCELLULAR LOCATION: Secreted.
-:-TISSUE SPECIFICITY: Expressed by the venom gland.
                                                                        MEDIINE=98232223; PubMed=9565405; Tripathy A., Resch W., Xu L., Valdivia H.H., Meissner G.; Ingeratoxin A induces subconductance states in Ca2+ release channels (ryanodine receptors) of cardiac and skeletal muscle."; J.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RP SEQUENCE FROM N.A.

RC STRAINBAILSTOOLN.A.

RC WormBase Consortium,

Submitted (SEP-2004) to the EMBL/GenBank/DDBJ databases.

CC -1 SUBCELLULAR LOCATION: Nuclear (By similarity).

-1 SINGLARITY: Belongs to the nuclear hormone receptor family.

"Human deltex is a conserved regulator of Notch signalling.";

I. Nat. Genet. 19:74-78(1998).

- I- FUNCTION: Functions as a receptor for membrane-bound ligands
Jaggedl, Jagged2 and Deltal to regulate cell-fate determination.

C Jupon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus.

Affects the implementation of differentiation, proliferation and apportic programs May be important for normal lymphocyte current for normal lymphocyte complex with apportic programs. May be important for normal lymphocyte contribute to transformation or progression in some T-cell neoplasms. Involved in the maturation
                                                                                                                                                                                                              Gaps

brain stem and lung. Also present in most adult tissues where it is found mainly in lymphoid tissues.

-!- PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).

First the membrane (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright. -1- SIMILARITY: Contains 5 ANK repeats.
-1- SIMILARITY: Contains 35 EGF-like domains.
-1- SIMILARITY: Contains 3 Lin/Notch repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PROSITE; PS50088; ANK REPEAT; 4.

J. Balol. Chem. 264:3007-3012(1989).
-!- FUNCTION: Mediates adherence of E.histolytica to colonic mucins, an essential step for pathogenic tissue invasion.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- PIM: Phosphorylated regions may have a role in signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SEQUENCE OF 16-30.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nam S.-C., Choi K.-W.,
"Interaction of Par-6 and Crumbs complexes is essential for
"Interaction of Par-6 and Crumbs complexes is essential for
photocreceptor morphogenesis in Drosophila.";
Development 130:4369-4372(2003).
-!- FUNCTION: Plays a central role in cell polarity establishment.
Participates in the assembly, positioning and maintenance of
adherens junctions via its interaction with the SAC complex.
Controls the coalescence of the spots of zonula adherens (ZA) into
a adhesive ring around the cells. It may act as a signal. Involved
in morphogenesis of the photoreceptor rhabdomere, for positioning
and growth of rhabdomere and AJ during the crucial period of
photoreceptor extension along the proximodistal axis of the
                                                                                                                                                                                                                                                                                                   MEDLINE=99200394; PubMed=10102271; DOI=10.1016/S0092-8674(00)80593-0; Bhat M.A., Izaddoost S., Lu Y., Cho K.-O., Choi K.-W., Bellen H.J.; "Discs Lost, a novel multi-PDZ domain protein, establishes and maintains epithelial polarity."; Cell 96:833-845(1999).
